As a team, they offer you the most professional, comprehensive pest management solutions available today. Continual Technical Training backed with hands-on field experience in all facets of pest management means that your pest problem will be solved quickly, safely and with a minimum of inconvenience to you.

THE BUG S

we integrates diversified pest management programmes

Jumeirah Pest Control Services specializes in **Total Pest Management (TPM)** programme, an approach to pest control that combines all available methods of preventing pests in a given environment based on integrated pest management. In our TPM programs, pesticides are used only when necessary to achieve acceptable levels of control with the least possible harm to humans, non-target organisms and the environment.

TPM methods may be biological, such as employing growth regulators or biological agents like mosquito dunks; mechanical, using traps or other exclusion techniques; or even cultural, such as focusing on better sanitation and house keeping to prevent pest-conducive conditions.

Total pest management system (TPM).....Any Bug, Any time, Any where

- ✘ Total pest eradication very effectively by eliminating the chance of reinfestation
- ✘ The cost of pest management can be considerably reduced

JPC's **Total pest management** Protection system

The key to JPC's success is the process we use to determine the most appropriate IPM program and treatment-and-monitoring strategy for each facility. JPC's technicians follow a seven-step process for each and every client:

1. **Inspection**

A comprehensive inspection is conducted at every facility. Extra attention is given to the five pest-activity zones: entry points, water sources, food sources, harborage and breeding points, and customer and employee areas.

2. **Facility Layout Analysis**

After the comprehensive inspection, all current and potential problem areas are noted. It is important to identify the operation's traffic patterns, including the number of people who enter and exit the building everyday.

3. **Pest Identification**

Different types of pests require different types of treatments depending on their life cycle and habitat and characteristics. Operators and customers must team up with facility employees to accurately report where, when, and how many pests were seen in order to help prevent infestations and control existing problems.

4. **Customized Program**

There is too many variables to provide "cookie cutter" solutions for individual facilities. Location, climate, the condition of the building, and its age all play a role in determining a treatment program. A comprehensive inspection and analysis of the facility, including interviews with key employees, help JPC develop an effective pest control program tailored to the customer.

5. **Sanitation Consultation**

The focus of every IPM program is a daily sanitation schedule. That schedule directly impacts factors that contribute to pest buildup, inside and out.

6. **Treatment Strategies**

Non-chemical control options are always used before chemical control options are considered.

7. **Ongoing Monitoring & Maintenance**

This step is absolutely essential to the success of IPM. This includes accurate reporting of pest sightings and proper documentation for clients and regulatory agencies.

Just A word before you proceed further

May we have your attention for a moment to have a look into the scientific theory of pest management?

We are really proud to inform you that we have scientifically designed a novel concept in the area of pest control with the name **Total Pest Management System (TPM)** which is based on the integrated pest management concept. TPM is a seven step process in which we assure you the state of the art service in the pest management.

So when we take care of your pest problems it is a security for ever. We are the watch guards of all pest intruders at your premises without any inconvenience to you.

We are 100% sure that you will be able to evaluate our quotation and our 100% sincere service logically.

"When dedicated workmanship is your top priority, don't look further"

THE BUG STOPS HERE

Pests for **'all seasons'** rats and mice are serious pests because of their ability to spread a number of diseases and the damage they can cause to food products and buildings. The diseases they can spread include food poisoning, some parasitic and viral diseases Weils disease is caused by a bacterium found in the urine of rats.

Flies The common housefly is uncommonly dangerous, probably the most dangerous pest of all. This is because it is so difficult to control and has the ability to spread a large number of diseases; particularly those linked with food.

Ants Like wasps and bees, ants are social insects. They nest underground and are close to or under buildings. They can cause contamination problems.

Wasps Wasps do not spread infectious diseases in the same way that flies and cockroaches do, but they can contaminate food and can deliver a painful sting, which to hypersensitive individuals can be life threatening.

Fleas Fleas are parasites of warm blooded animals like cats and dogs. Most domestic infestations are caused by cat or dog fleas.

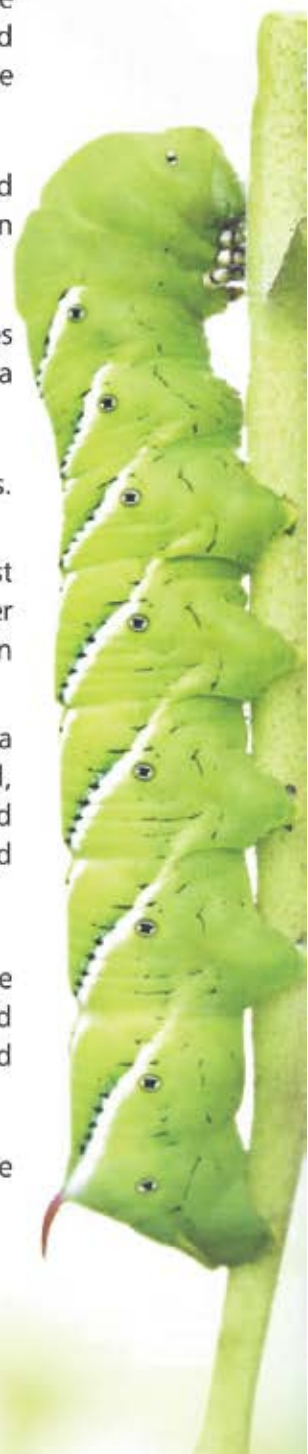

Cockroaches Cockroaches are another serious public health pest because they can spread a large number of gastro-intestinal and other diseases. American and German species of cockroaches are very common in Dubai.

Insects that damage fabrics and/or contaminate food There are a number of insects that damage fabrics and/or contaminate food, including all sorts of beetles, weevils and moths. They contaminate and destroy food products, and some may cause damage to clothes and furnishings.

Bedbugs Bedbugs are parasites that feed on human blood. They are found anywhere humans live. During the daytime they hide in cracks and crevices in furniture and fabrics. At night they come out for their blood meal. If no suitable host is available, bedbugs can survive for months.

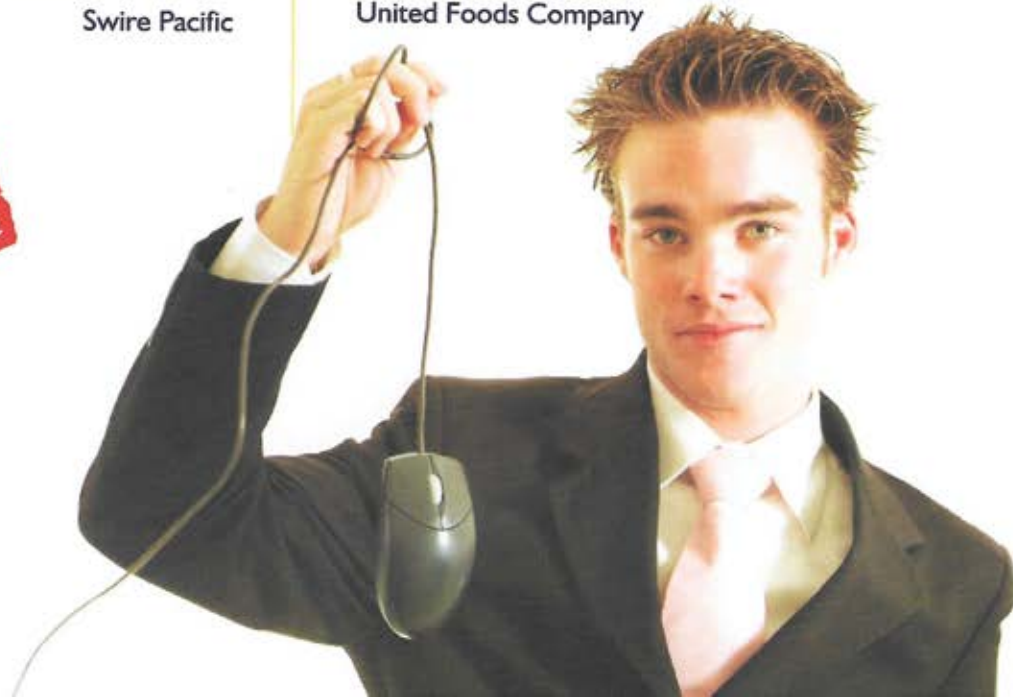

Redback Spider is poisonous and now very common in Dubai. Its bite can cause acute pain and even lead to anaphylactic shock.
